

Nepal's Tiger Population Quadruples

ARTICLE READING

Nepal has achieved a remarkable conservation milestone, officially announcing that its wild tiger population has climbed to 429—nearly quadrupling from just 121 in 2010. Driven by anti-poaching initiatives, habitat restoration, and active community participation, Nepal has outpaced global expectations to become a world leader in big cat preservation. However, this booming population presents a new challenge: the nation's forests have an estimated carrying capacity of around 400 tigers. With the animals pushing past habitat boundaries, local communities and conservationists now face the delicate balance of managing human-wildlife coexistence.
